QUESTION

With regard to government statistics on the causes of death in Canada: (a) what were the top 50 leading causes of death for each year and quarter since 2014, broken down by sex, age interval, geographic location of death, type of location of death (long term care home, hospital, etc.); and (b) for the statistics in (a), from 2021 onwards, what is the breakdown by COVID-19 vaccination status?

REPLY / RÉPONSE

ORIGINAL TEXT / TEXTE ORIGINAL [X] TRANSLATION / TRADUCTION [ ]

Please see the attached annex for a detailed response from Statistics Canada.

Notes:

Source: Statistics Canada, Canadian Vital Statistics Death Database (CVSD)

The CVSD is an administrative survey that collects demographic and cause-of-death information annually and monthly from all provincial and territorial vital statistics registries on all deaths in Canada. In the event of a death attributed to COVID-19, information on vaccination status is not collected through this process. As such, we cannot provide the breakdown by vaccination status requested in part b).

With respect to the locality of death:

- “Hospital” refers to a facility licensed to operate as a hospital under the provincial, territorial, or federal government.
- “Other health care facility” includes nursing homes, other long-term care facilities, nursing stations, other short-term care facilities, and other health care facilities not licensed to operate as hospitals by provincial, territorial, or federal governments, such as freestanding birthing centres.

There are some provincial differences in the reporting of the information on the locality of death that might limit its usefulness:

- In Quebec, deaths in residential and long-term care centres are included under “hospital.” Quebec uses “private dwelling” to refer to the decedent’s home only. If the death occurred at a residence that was not the decedent’s residence, then it is coded as “other locality.”
- As of 2014, Saskatchewan no longer reports “private dwellings”; these cases are now reported as “other localities.”
- In New Brunswick, prior to 2016, hospitals (emergency room, outpatients, and patients dead-on-arrival) were coded as either “hospital,” or “other health care facility,” or “other locality.” As of 2016, these deaths are coded only as “other locality,” with only hospital (in-patient) deaths coded as “hospital.”
- Starting in August 2018, deaths registered by Manitoba where the death occurred in a personal care home will have a locality of death “other health care facility” instead of “hospital.”

…/2

The tabulation of the causes of death is based on the underlying cause of death, which the World Health Organization defines as the disease or injury that initiated the train of events leading directly to death or as the circumstances of the accident or violence that produced the fatal injury. The underlying cause of death is selected from the causes and conditions listed on the medical certificate of cause of death completed by a medical professional, medical examiner, or coroner.

The list for ranking leading causes of death in this table is based on the list of 51 rankable causes developed and used by the National Center for Health Statistics of the United States in their annual report on leading causes of death. The number of deaths determines the ranking of the leading causes.

The category "Other causes of death (not ranked)" is a residual category of all unrankable causes of death.

Data for Yukon have not been received by Statistics Canada for reference years 2017 onward.

Figures for reference years 2014 to 2016 are based on the revised CVSD data released in January 2020.

Figures for reference years 2017 to 2020 are based on revised and preliminary datasets released in January 2022.

Figures for reference years 2021 and 2022 are based on the provisional datasets released on May 11, 2023. It is estimated that the numbers provided for 2021 and 2022 represent 99.9% and 96.3% of the deaths that occurred during these two years. However, among those deaths that have been reported to Statistics Canada, the causes of death have either not been reported or are pending an investigation by a coroner or medical examiner for roughly 6% of the deaths that occurred in 2021 and 25% of the deaths that occurred in 2022 (and 47% of the deaths that occurred in Q4 of 2022). The absence of this information affects some jurisdictions more than others. Decreases in deaths attributed to a particular cause for these years with respect to previous years/quarters should be interpreted with caution.

Insufficient data have been received from the provinces and territories to provide the first quarter of 2023.

All figures have been randomly rounded to a neighbouring multiple of 5 by the disclosure control practices of the CVSD.

Q-1520

Q-1520[2] — May 5, 2023 — Mr. Carrie (Oshawa) — With regard to government statistics on the causes of death in Canada: (a) what were the top 50 leading causes of death for each year and quarter since 2014, broken down by sex, age interval, geographic location of death, type of location of death (long term care home, hospital, etc.); and (b) for the statistics in (a), from 2021 onwards, what is the breakdown by COVID-19 vaccination status?
